

Metaform Accessories

Unirail Top Extender Strip.

A U.V. stable plastic strip that clips firmly to the top of the Unirail, giving an additional 15mm in height, strengthens top edge for screeders and striker tubes to run on, can be left in the floor or removed as required.

Metajunction.

The Metajunction is designed to assist in transition where a junction in the joint is required. It can be used to construct a corner, a 'T' intersection, or a crossroads. Simply attach the product to one end of the joint with the supplied plastic bolts and wingnuts, then butt the other joints up to it.

Pre-cut Compressible Foam Strip.

A 20mm thick, 3 metre long, 200mm deep foam strip for fitting between rails on the Duo and Eliminator joints, used where the joint gap is

expected to close (external slabs, etc....) pre-cut to permit simple tear off of top 20mm to allow for joint filler if required.

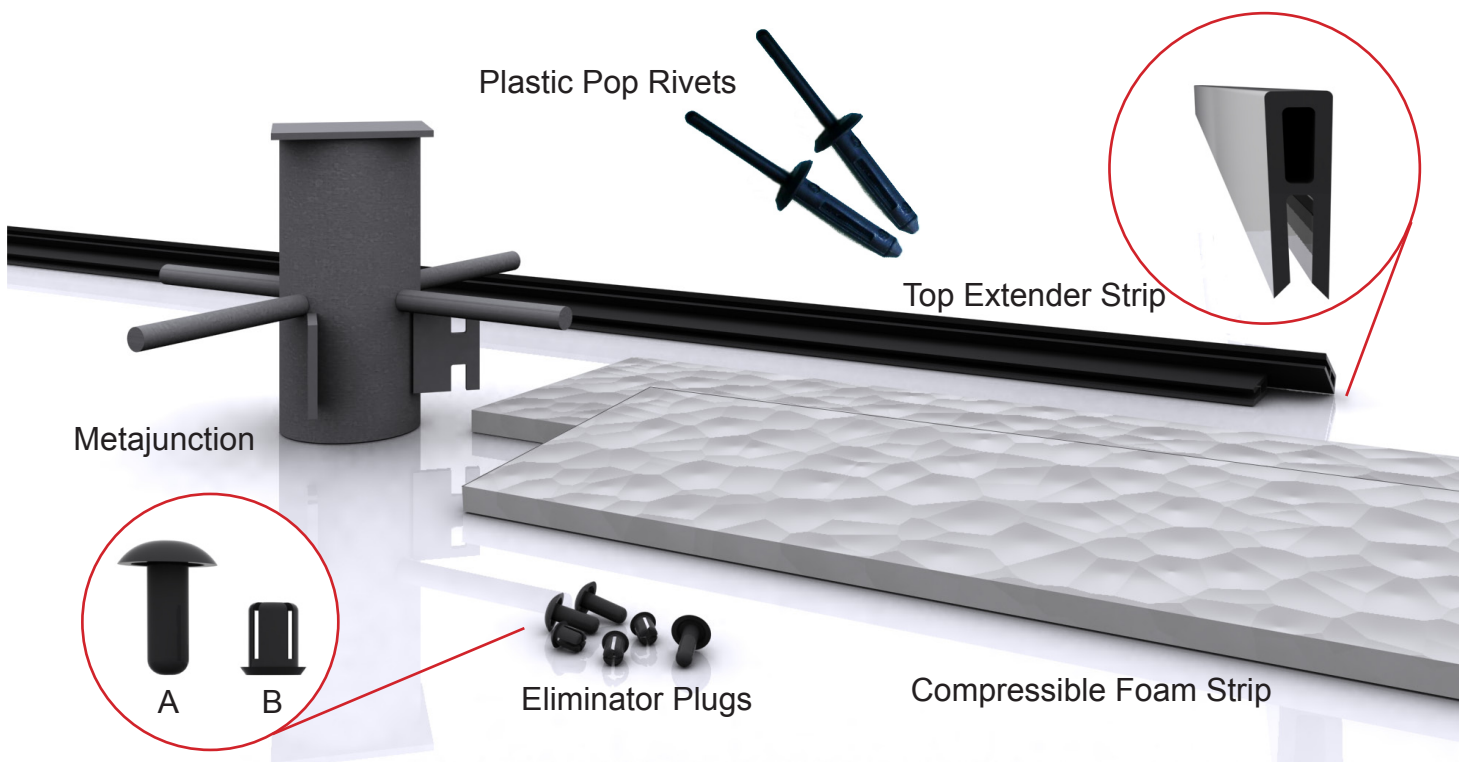

Eliminator Top Strip Plugs.

A simple plastic thumb operated "pop" plug, for putting in the holes in the Eliminator top strip if required – prevents dirt and moisture getting into the joint gap. If rivet heads are not wanted showing – use only part "B" and fill with mastic.

Breakaway Plastic Pop Rivets.

Recommended for quick assembly of joints and for fixing dowel sleeves etc... to Metalform rails. These quick fit rivets shear at a known value, allowing the joints to open up correctly without causing damage.

*Note – steel nuts and bolts or rivets must not be used to fix joints.
